                                                                                                  the
```

The invention relates to a method of identifying (M1) a molecule that modulates biological activity of native quadruplex DNA, by contacting test quadruplex DNA with candidate molecule, and determining presence absence of interaction between candidate molecule and test quadruplex DNA, where candidate molecule that interacts with test quadruplex DNA.

           microsateIlite sequences given in GenBank AP077550-AF077598. (I), the complementary sequence or fragment and the encoded polypeptide are useful for mapping of the genome of various species of shrimp. Mapping the genome of Penaeus is useful for determining whether a test shrimp, preferably litopenaeus vannemei, has a genotype associated with a phenotypic trait such as resistance to Taura Syndrome Virus (TSV) infection. The present sequence is that of a probe, useful in examples of the invention. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     receptor protein is designated SHTR2B. SHTR2B is a G protein coupled receptor (GPCR) which comprises 7 transmembrane regions. The specification describes a method for using a specific inhibitor of the SHT2B receptor to prepare a composition for treating a solid epithelial tumour in which the SHT2B gene is overexpressed. Inhibition of the SHT2 receptor blocks cell proliferation and invasion. Inhibitors of the invention are used to treat or prevent uncological tumours (particularly of prostate, bladder and kidney), but also cancers of the breast, lung and colon. The detection of overexpression of SHTR2B, or the related mRNA, is used for in vitro detection of tumorous cells.
                                                                                                                                           The invention relates to an isolated polynucleotide (I) of the giant black tiger prawn, Penaeus monodon or expressed sequence tags of the pacific white shrimp, Litopenaeus vanmened (ABN00997-ABN81172), both containing microsatellites sequences including those P. monodon

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region, 5' or 3' intron-exon junction, intron or region codon, coding region of the 5'-end or 3'-end of a nucleic acid target codon from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, EDE4 C, or PDE4 D. The oligonucleotides are cuseful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease as associated with hyper-responsiveness to CC and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or levels of adenosine A CC is chosen from airway inflammation, allergy, asthma, impeded respiration, CC cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), and control obstructive pulmonary disease (COPD),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel single or multiple target oligonucleotide anti-sense to e.g. Constitution codon, intron of respiratory disease-relevant gene e.g. CORANTES, MCP4, useful for prophylaxis or treating respiratory disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; respiration; cytic fibrosis; CF; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension; lung inflammation; bronchitis; airway obstruction; bronchoconstriction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the prevention and/or treatment of a respiratory or lung disease. The oligonucleotides are useful for reducing or inhibiting expression of a gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; ss; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-5; CCR1; CCR3; Botaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PDE4 A; PDE4 B; PDE4 C; PDE4 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; allergy; inflammatory disease; CPD; allergic rhinitis; creciptor; control obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension;

New compound targeted to a nucleic acid molecule encoding inhibitors apoptosis (IAP)-like and inhibits expression of IAP-like, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of adenosine A receptor(s), and/or asthma and/or lung allergies associated with inflammation or an inflammatory disease. The respiratory or lung disease is chosen from airway inflammation, allergy, asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary disease (COPD), allergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction. This sequence represents an oligonucleotide of the

The compound is useful for modulating the expression of IAP-like. It is also useful for diagnosing or treating diseases associated with expression of IAP-like, e.g. a hyperproliferative disorder. This sequence represents a human inhibitor of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 2146
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a compound 8-80 nucleobases in length targeted to CC a nucleic acid molecule encoding inhibitors of apoptosis (IAP)-like, where the compound specifically hybridises with the nucleic acid molecule encoding IAP-like comprising 16000 bp (SEQ ID NO. 4) and inhibits the CC expression of IAP-like. Also described are: inhibiting the expression of IAP-like. Also described are: inhibiting the expression of CC IAP-like in cells or tissues; screening for a modulator of IAP-like; a CC diagnostic method for identifying a disease state comprising identifying the presence of IAP-like in a sample using at least one of the primers CC the presence of IAP-like in a sample using at least one of the probe comprising SEQ ID NO. 7; a kit or assay device comprising the compound; and treating an animal having a disease or condition associated with IAP-like. The compound is useful for modulating the expression of IAP-like. CC like. The compound is useful for modulating the expression of IAP-like, e.g. a hyperproliferative disorder. This sequence represents a human inhibitor of apoptosis (IAP)-like antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      encoded protein thereof that is involved in immunoregulation activity. Specifically, it refers to a method to test for the immunity balance or ratio between Th1 and Th2 helper T cells. The present invention describes the target helper T cell proteins that are activated or suppressed by Th1/Th2, and include the Th1 targets C/EBP (alpha), GATA-4, Notch-4, IRS-4, placental Ca2+ binding protein, CD6, Galactin-3, CD97, DEC1, Onzin, GBP3, CD49b, CD29 and BMP-10, whereas the functional molecules of the Th2 lymphocyte include integrin(betal7, PCSK3, GP49b, CTLA-2(alpha), TDAG51, CD53, laminin(alpha)5, PPAR(gamma), ECM1, CRABP2, CYP11A(P450scc), 20(alpha) - hydroxysteroid dehydrogenase (20-alpha-HSD) and CCR2.
20(alpha) - the method further involves using the gene of the functional molecule of helper T cell, a gene product, an antibody of the gene product and at least one of the cells transduced with the gene as an antibody of the gen

The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject. Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slet, lung, bone marrow or stem cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonucleotide marker for diagnosis and monitoring of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human CARK/FPGT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cardiac ankyrin repeat kinase/fucose-1-phosphate guanylyltransferase, CARK/FPGT, proximal probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ss; antisense; squalene synthase; farnesyl diphosphate farnesyl transferase 1; cholesterol; atherosclerosis; coronary heart disease; hypercholesterolaemia.

Also included are inhibiting the expression of squalene synthase, neells or tissues, screening for a modulator of squalene synthase, a diagnostic method for identifying a disease state, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with squalene synthase. The compound and methods are useful in diagnosing and treating disorders related to cholesterol biosynthesis e.g. atherosclerosis, coronary heart disease and hypercholesterolaemia. The present sequence is an antisense oligonucleotide of the invention.
                                                                                                                               The present invention is directed to antisense oligonucleotides which are targeted to mucosa-associated lymphatic tissue (MALT) 1 and which modulate the expression of MALTI. The invention is useful for preparing a composition for treating hyperproliferative disorder such as cancer. The invention acts as a cytostatic agent. The invention is also useful in gene therapy. The present sequence is human MALTI target oligonucleotide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                         New oligonucleotide compound that inhibits expression of MALT1, useful for preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mucosa-associated lymphatic tissue 1; MALT1; hyperproliferative cancer; cytostatic; gene therapy; human; ss.

The invention is useful for preparing a composition for treating hyperproliferative disorder such as cancer. The invention acts as a cytostatic agent. The invention is also useful in gene therapy. The present sequence is human MALT1 antisense oligonucleotide. This sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New oligonucleotide compound that inhibits expression of MALT1, useful for preparing a composition for treating hyperproliferative disorder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens.

                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound targeted to a nucleic acid molecule encoding SLC26A2. The antisense oligonucleotide is useful for inhibiting the expression of SLC26A2 in cells or tissues to prevent or treat diseases associated with aberrant SLC26A2 expression, such as chondrodysplasia. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The present sequence represents a human SLC26A2 target sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              invention is useful for treating a disease or condition associated with Talin such as a disease or condition e.g. muscular, haematologic, cardiac or hyperproliferative disorder such as cancer. The present sequence is an antisense oilgonucleotide targeted to human Talin DNA.
                      New antisense oligonucleotides which inhibit the expression of dual specific phosphatase 6, useful for e.g. treating disease or condition associated with the expression of dual specific phosphatase.
                                                                                                                                                                                                                                                                                                   Human; antisense; ss; dual specific phosphatase 6; DUST6; MAP kinase; extracellular signal related kinase; ERK; hyperproliferative disorder developmental disorder; neural disorder; apoptotic disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         NO: 4. The oligomeric compound hybridises to nucleobases 53-195 in the 5' UTR of ADP96435 or to nucleobases 1757-1860 in the 3' UTR of ADP96435. The antisense compound is useful for inhibiting the expression of dual specific phosphatase 6 and for treating a disease or condition associated with the expression of dual specific phosphatase 6 (e.g. a hyperproliferative disorder, developmental disorder, neural disorder or a apoptotic disorder. These may also be used as research reagents and diagnostics, to distinguish between functions of various members of a biological pathway, and in the treatment of a disease or disorder, which can be treated by modulating the expression of dual specific phosphatase 6. The DUSTS gene is located on chromosome 12922-23. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or diluent) and a method of inhibiting the expression of dual specific phosphatase 6 in cells or tissues comprising contacting the cells or tissues with the antisense oligonucleotide. The oligomeric compound inhibits the expression of dual specific phosphatase 6 by at least 60%, and hybridises to nucleobases 369-389, 480-500, 657-677, 713-818, 923-1028, 1196-1216, 12771693, or 1757-1860 in the coding region of SEQ ID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an oligomeric compound (an antisense oligonucleotide) 8-50 nucleobases in length comprising a sequence complementary to a nucleic acid molecule encoding dual specific phosphatase 6 (DUST6, phosphorylating Map kinase and extracellular signal related kinase, ERK) appearing as ADP96435. Also included are a composition comprising the oligonucleotide (and a pharmaceutical carrier

                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligomeric compound (an antisense CC oligonuclectide) 8-50 nucleic acid molecule encoding a sequence cc complementary to a nucleic acid molecule encoding dual specific composition comprising the oligonucleotide (and a pharmaceutical carrier cc composition comprising the oligonucleotide (and a pharmaceutical carrier cc phosphatase 6 (DUST6, phospharing as ADP96435. Also included are a cc composition comprising the oligonucleotide (and a pharmaceutical carrier cc phosphatase 6 in cells or tissues comprising contacting the cells or tissues with the antisense oligonucleotide. The oligomeric compound cc inhibits the expression of dual specific phosphatase 6 by at least 60%, cc and hybridises to nucleobases 369-389, 480-500, 657-677, 713-818, 923-cc 1028, 1196-1216, 12771693, or 1757-1860 in the coding region of SEQ ID CC Wrs of ADP96435 or to nucleobases 1757-1860 in the 3' UTR of ADP96435 or to nucleobases 1757-1860 in the 3' UTR of ADP96435. CC Wrs of ADP96435 or to nucleobases 1757-1860 in the 3' UTR of ADP96435. CC The antisense compound is useful for inhibiting the expression of dual specific phosphatase 6 (e.g. a hyperproliferative disorder, developmental disorder, neural disorder or a apoptotic disorder. These may also be used as research reagents and cc diagnostics, to distinguish between functions of various members of a cc biological pathway, and in the treatment of a disease or disorder, which cc an be treated by modulating the expression of dual specific phosphatase cc is an antisense oligonucleotide targeting DUST6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                   The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448.                                                                                                                                                                                                                                                              The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human rumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                    The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV; HER; HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448. ```

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor beginning at nucleotide 1137 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by

human

                                                                                                                         Recombinant cells transformed with DNA encoding a SHT5a serotonin receptor express the receptor on their surfaces. They can be used in tests to identify ligands or modulators of the receptor and serotonin agonists and antagonists which may be useful in the treatment of SHT5a associated disorders. Probes for the SHT5a receptor (AAQ56313-18) can be used to detect expression of SHT5a; to detect genetic abnormalities due to incorrect splicing, polymorphisms and point mutations; to diagnose neurological, cardiovascular or psychiatric disorders related to SHT5a and to detect/isolate homologous nucleic acid sequences encoding SHT5a polypeptides.                                                                                                                     AAQ71998-72000 and AAQ72003-9 are probes disclosed for use in the invention. The invention is for an improved method of detecting specific nucleic acids by a flow-through membrane nucleic acid hybridisation assay. This oligonucleotide is a capture probe and the base sequence corresponds to serovar L2 of Chlamydia trachomatis major outer membrane protein (MOMP) nucleotides position 747-766. The probe has a mixture of (AMINO MODIFIER II, Clontech) at the 5'end. Pref. the membrane comprises nylon with streptavidin in a test site. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                 Flow-through membrane nucleic acid comprising nylon with streptavidin including biotin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nested PCR primers (AAT48848-51) were designed to obtain a full-length coding sequence for rat brain adenosine kinase (AK). These primers bind to the 5' and 3' untranslated regions of the gene. Rat brain cDNA was initially amplified with outer primers (AAT48848) AAT48850) and then with the inner primers (AAT48849, AAT48851). The PCR fragment was cloned into pGEM-T and inserts from multiple clones were sequenced. A full-length consensus sequence (AAT48843) coding for rat brain AK (AAM08369) was obtd
                                                                                                              11-DEC-1997.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZS5812-Z26625 represent human polymorphic sites described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for identifying an inhibitor CC potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is CC subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is CC used for preventing the development of cancer in a patient a first allele CC precancerous condition, by administering to the patient a first allele CC specific inhibitor (ASI) targeted to an allele of a first essential gene CC present in cells of the precancerous condition, where the normal somatic cc cells of the patient are heterozygous for the first gene, the inhibitor CC is active on at least one but less than all allelic forms of the gene CC present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be cused in the diagnosis, prevention and treatment of LOH disorders, e.g. CC cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and CC graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 represent with the content of LOH disorders of the content cells from bone marrow transplants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

Cells transformed with the DNA are used t produce recombinant AK. The AK is used: (i) to screen for specific agonists and antagonists; (ii) to raise antibodies; and (iii) therapeutically (reduced levels of AK are associated with resistance to nucleoside analogues with cytotoxic, anticancer and antiviral propertie with liver tumours, gout and acquired immune deficiency syndrome). Fragments of the DNA sequence are used as primers and probes to screen DNA libraries and for identifying AK-encoding nucleic acid, also as antisense therapeutics (particularly to increase local adenosine concentrations at the site of tissue injury, increasing the level of
             B. thuringiensis crystal proteins can be used in compositions as an insecticide. The polynucleotides encoding the crystal proteins are used to detect a nucleic acid encoding a delta-endocoxin polypeptide and to transform plants such as corn, wheat, oat, rice, barley, turf grass,
                                                                       The present invention describes Bacillus thuringiensis crystal proteins, which have insecticide activity and are mid-gut cell wall disruptors. The
                                                                                                                                                        New Bacillus thuringiensis polypeptide for use as an insecticide in protecting plants, such as, corn, wheat, oat, tobacco, or potato plants and in controlling insect populations, such as, Colorado potato beetle
                                                                                                                                                                                                                                                                                                                                                                                                       WO200066742-A2

                                                                                    The present invention relates to a method for detecting polymorphisms in a nucleic acid sequence. The method comprises amplifying nucleic acid sequences with a first primer homologous to a miniature inverted-repeat transposable element (MITE) in combination with another primer (non)homologous to MITE, separating the amplified nucleic acid fragments, and analysing the fragments obtained in relation to reference fragments obtained from the amplification of the nucleic acid with the primer homologous to MITE. The present sequence is a primer used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  berry, vegetable or tree to make it insect resistant. Insect populations, such as, Colorado potato beetle and southern rootworm can be controlled by expressing the crystal proteins in a plant. The crystal proteins can be used to kill or reduce the numbers of target insects in an area or applied to an area to prevent infestation by a susceptible insect. Antibodies to the crystal proteins are used to detect them in a sample. The crystal proteins are only distantly related to other delta-endotoxins toxic to dipteran or coleopteran insects and so provide for a new insecticide which insects have not become resistant to. The present sequence represents an oligonucleotide primer for the B. thuringiensis CryET75 protein, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                Detecting polymorphisms of nucleic acid, useful for e.g. tracing progeny, by amplifying the nucleic acid with a homologous and a nonhomologous primer to a miniature inverted-repeat transposable element.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thrombosmbolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids comprising single nucleotide polymorphisms, useful applications such as forensics, paternity testing, medicine, gene analysis and phenotype correlations to diseases such as diabetes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmaceutical. SNP containing oligonucleotides are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an antigenic peptide fragment having at least 90% identity to a 162 amino acid sequence (AAM52131) given in the specification for equine arteritis virus (EAV) (Bucyrus strain) membrane protein (M). The antigenic peptide fragments (or peptide conjugates) are useful to diagnose infection of horses with EAV, the causative agent of equine viral arteritis, without reliance on clinical signs which may be variable and are undetectable in animals with subclinical infection. They can be used to detect antibodies to EAV, by incubating a sample with the fragment/conjugate as a specific binding agent (e.g. an immobilized binding agent or labeled secondary binding agent) and identifying any EAV antibodies present e.g. by enzyme-linked immunosorbent assay (ELISA). The proteins
  This invention describes a novel nucleotide support (A; gene chip) carries a selection of oligonucleotides (I) that are identical, or complementary, to segments of reference sequences relevant to at 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            phenylketonuria; maple syrup disease; galactosemia; homocysteinuria; medium-chain acyl-CoA-dehydrogenase deficiency; biotinidase deficiency; familial hypercholesterolemia; familial defective apolipoprotein-B;
                                                                                                                                                       DNA chip, useful for neonatal or prenatal screening for many genetic diseases simultaneously, carries oligonucleotides complementary to phenotypically relevant reference sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                           21-JAN-2000; 2000DE-01002446
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        09-JAN-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             26-JUL-2001

(A) are used for simultaneous diagnosis of at least two of the following diseases: phenylketonuria (maple syrup disease), galactosemia, homocysteinuria, biotinidase deficiency, medium-chain acyl-coA-dehydrogenase deficiency, familial hypercholesterolemia, familial defective apolipoprotein-B, cystic fibrosis, Marfan syndrome, Smith-Lemil-Opitz Syndrome and androgenital syndrome. Specifically they are used in neonatal or prenatal diagnosis. (A) require a relatively small number of separate hybridization regions (about 500 for testing for 21 specified disorders), so can be used for simultaneous testing for many diseases. Testing is quick, inexpensive, reliable and more sensitive than current physiological methods. AAH48866 AAH48866 represent oligonucleotides used to illustrate the method of the part of the state of 
                                                                                                                                                                                                                                      DNA chip, useful for neonatal or prenatal screening diseases simultaneously, carries oligonucleotides cophenotypically relevant reference sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            phenylketonuria; maple syrup disease; galactosemia; homocysteinuria; medium-chain acyl-CoA-dehydrogenase deficiency; biotinidase deficiency; familial hypercholesterolemia; familial defective apolipoprotein-B; cystic fibrosis; Marfan syndrome; Smith-Lemil-Opitz syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAH48868-
```

complementary, to segments of reference sequences relevant to at least two genetically determined phenotypes. (A) are used for simultaneous diagnosis of at least two of the following diseases: phenylketonuria (maple syrup diseases), galactosemia, homocysteinuria, biotinidase deficiency, medium-chain acyl-CoA-dehydrogenase deficiency, familial hypercholesterolemia, familial defective apolipoprotein-B, cystic

invention describes a novel nucleotide support (A; gene chip) which es a selection of oligonucleotides (I) that are identical, or

Specifically they are used in neonatal or prenatal diagnosis.

(A) require a relatively small number of separate hybridization regions (about 500 for testing for 21 specified disorders), so can be used for simultaneous testing for many diseases. Testing is quick, inexpensive, reliable and more sensitive than current physiological methods. AAH488668-AAH489166 represent oligonucleotides used to illustrate the method of the
The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP; AAH89797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used if forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                  Claim
                                                                                                                                                                  New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                 Au
                                                                                                                                                                                                                                                                                                                      (GLAX )

                                                                                                                                                                                                                                                The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucles that has been oligonucleotides can be used forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                                                                                                                                                        New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 21

The invention relates to an isolated nucleic acid from a human gene concoding aminopeptidase P (XPNEPZ), bradykinin receptor B1 (BDKRB1), CC tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein CC 1 (KLKI), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme CC (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position as provided in the detailed summary of single CC nucleotide polymorphisms comprising additional 5 and 3 flanking genomic Sequence; (2) analysing (M1) at least one nucleic acid sample comprising constaining the sample from one or more individuals and determining the CC nucleic acid sequence at one or more polymorphic positions in a gene CC encoding a protein selected from the group above; (3) constructing (M2) the polymorphic of an ACE inhibitor and/or vasopeptidase inhibitor CC using the polymorphic data; (5) a library of nucleic acids, each of which CC comprises one or more polymorphic positions within a gene encoding a conditional selected from the group above; and (6) genotyping (M4) an individual at nucleic acids, each of which CC comprises one or more polymorphic positions within a gene encoding a conditional selected from the group above; and (6) genotyping (M4) an individual at nucleic acids sample, determining the conditional comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 2182

The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, preventing various disorders such as angioedaema and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, aneuryem, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atherosclerosis, and hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPP) and enterocolitis (many other disease and disorders are listed in the specification). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cardiovascular disease; angina pectoris; hypertension; heart failure; myocardial infarction; ventricular hypertrophy; vascular disease; aneurysm; embolism; thrombosis; coronary artery disease; angioedaema;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification
                                                                                                                              Tsuchihashi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC encoding aminopeptidase P (XPNREP2), bradykinin receptor B1 (BRCR1), Cl (ACLX1), bradykinin receptor B2 (BRCRE2), angiotensin converting enzyme CC (ACE2) or protease inhibitor 4 (PI4), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a CC polymorphic position. Also included in the detailed summary of single composition as provided in the detailed summary of single polymorphic positions as provided in the detailed summary of single compositions comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising comprising comprising the genes comprising prouping and determining the cencoding a protein selected from the group above; (3) constructing (M2) CC haplotypes using the genes comprising grouping at least two nucleic acids comprising the polymorphic data; (5) a library of mucleic acids, each of which CC using the polymorphic data; (5) a library of mucleic acids, each of which CC units of the polymorphic positions within a gene encoding a comprising obtaining a nucleic acid sample, determining the composition within a gene encoding and compositions are useful for detecting, diagnosing, treating, and compositions within a gene encoding at least one polymorphic positions within a gene encoding the conditions provides and cardiovascular diseases like anglia pectoris, and compositions within a gene encoding the conditions are useful for detecting, diagnosing, treating, at CC hypertension, heart failure, myocardial infarction, ventricular hypertension, heart failure, myocardial infarction, ventricular hypertension, heart failure, myocardial infarction, ventricular chypertension, and cardiovascular diseases like anglia pectoris, and compositions are useful for chromosome identification. Antibodies and biological samples are lase useful for chromosome identification. Antibodies and biologica

CC (RKIKI), bradykinin receptor B2 (BDKRB2), anglotensin converting enzyme CC (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC (ACE2) or protease inhibitor 4 (PI4), comprising at least one CC (ACE2) or position as provided in the detailed summary of single CC polymorphic position as provided in the detailed summary of single CC mucleotide polymorphisms comprising additional 5 and 3 flanking genomic CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising cobtaining the sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2) constructing (M2) encoding a protein selected from the group above; (3) constructing (M2) comprises one or more polymorphic positions and determining the polymorphic data; (5) a library of nucleic acids encoding the polymorphic data; (5) a library of nucleic acids encoding a protein selected from the group above; (3) constructing (M2) comprises one or more polymorphic positions within a gene encoding at individual comprising obtaining a nucleic acid sample, determining the nucleic acid sample, determining the comprises one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, correventing various disorders such as angioedaema and diseases which compertures and cancer, myocardial infarction, ventricular compertures, vascular diseases, aneutysm, embolism, thrombosis, coronary constructive pulmonary disease, aneutysm, embolism, thrombosis, coronary constructive pulmonary disease (COPD) and enterocolitis (many other construction of the specification. Antibodies are also useful for chromosome identification. Antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          autoimmune disease; inflammatory arthritis; cancer; wound; viral infection; bacterial infection; fungal infection; COPD; Chronic obstructive pulmonary disease; enterocolitis.
                                       polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid from a human encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 709; 977pp; English

cc comprises one or more polymorphic positions within a gene encoding a comprises one or more polymorphic positions within a gene encoding a chuman protein selected from the group above; and (6) genotyping (M4) and comprising obtaining a nucleic acid sample, determining the nucleic tide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, diagnosing, treating, compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, diagnosing, treating, compositions are useful for detecting, diagnosing, treating, may preventing various disorders such as angioedaema and diseases which compositions and cardiovascular diseases like angina pectoris, composition, heart failure, myocardial infarction, ventricular composition, heart failure, myocardial infarction, ventricular composition, vascular diseases, aneurysm, embolism, thrombosis, coronary archary disease, arteriosclerosis and/or atherosclerosis, and carcinoscular diseases, inflammatory composition, cancer, wounds, viral, bacterial or fungal infection, Chronic cobstructive pulmonary diseases (COPD) and enterocolitis (many other coliseases and disorders are listed in the specification). The coliseases and disorders are listed in the specification. Antibodies and biological samples. The present sequence is included in the sequence colisting but is not referred to anywhere else in the specification

ORG G S

Drug compositions containing expression vector for an immunosuppressive cytokine gene or soluble cytokine receptor gene for treatment of tumors and inflammatory disorders.

The invention relates to drug and inflammatory disorders in

cytokine gene or

compositions for the treatment of tumours the form of an expression vector for an ne or soluble cytokine receptor gene. The

This invention relates to the sequence of an isolated nucleic acid molecule comprising at least one base variation from that of a known human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2), cytochrome P450 02E1 (CYP45002E1), adrenergic receptor betal (ADBR1), aryl hydrocarbon receptor nuclear translocator
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             activity of compositions of the invention may be described as, cardiant, vasotropic and cytostatic. They may be used for treatment of tumours and inflammatory disorders, especially of vascular diseases such as viral myocarditis, and may be useful in gene therapy. The current sequence represents an IFN-gamma (interferon-gamma) related primer sequence #1
                                                                                                                                                                                                                                                                                                                                                       Guida M,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human multidrug resistance associated protein 3 polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 21

Pred. No.

23-DEC-2002 ABS98279 standard; DNA; 21 (first entry) ВP

(LTF) gene polymorphic sequence #42.

ABS98279
ID ABS9827
XX KW cytochrome P450 A1; CYP4501A1; UGT2B4; MDR1;
KW cytochrome P450 A2; CYP4501A2; cytochrome P450 02E; CYP45002E1; LTF;
KW adrenergic receptor beta1; ADBR1; arryl hydrocarbon; AHR; MRP3; NR112;
KW aryl hydrocarbon receptor nuclear translocator; ARNT; cathepsin S; CTSS;
KW cyclooxgenase 2; COX2; diazepam binding inhibitor; DBI; haematological;
KW epoxide hydroxylase 2; EPHX2; 5-lipoxygenase activating protein; FLAP;
KW glutathione-5-transferase 12; GST12; histamine-N-methyl transferase;
KW HNMT; kallikrein 2; KLK2; nicotinamide-N-methyl transferase; NNMT;
KW NADPH quinone oxidoreductase 2; NQO2; sulfotransferase thermolabile; STM;
KW NADPH quinone oxidoreductase 214; UDP-glucuronosyl transferase 2B7;
WUP-glucuronosyl transferase 2D4; UDP-glucuronosyl transferase 2B7;
KW UDP-glucuronosyl transferase; UGT2B15; urokinase receptor; uPA;
KW multidrug resistance 1; lactotransferain; orphan nuclear receptor; uPA;
KW multidrug resistance associated protein 3; cancer; prostate;
KW multidrug resistance associated protein 3; cancer; prostate;
KW multidrug metabolism; cardiovascular function; colorectal tumour;
KW altered drug metabolism; cardiovascular function; colorectal tumour;
KW altered system; pulmonary; immunological; SNP; single nucleotide polymorphism

```
CC molecule comprising at least one base variation from that of a known cytochrome P450 Al (CYP450)Al), cytochrome P450 Al (CYP450)Al (CYP450)Al), cytochrome P450 Al (CYP450)Al
